### **Leslie says**

This is a coveted book. I am waiting to be able to afford the next one which I think is South Texas. There will be four in the series when all is said and done. Keys and distribution tables. There will be no native I will not be able to key out. It will be interesting to see how many species will have disappeared by the time the series is completed. I only wish we had had this book earlier. A tremendous accomplishment by Shinner and Mahler

Hands down best resource for plant identification in the North Central Texas region. Well researched and documented ranges, black and white line drawings, botanical history of the area covered and more!
